

FERNS

Ferns do not flower, and thus are not angiosperms. They are among the oldest and most primitive plants on earth. Unlike most of the plants we have covered recently, they are not grouped in a particular family, but occur in several families.

Morphological Characteristics:

- Leaves are technically called “fronds”, and spores develop in structures on the underside of fronds called “sori”.

Native habitats:

GENERAL CULTURE

Media

- Terrestrials
- Epiphytes

Temperature

Light

- Natural light
- Artificial light

Humidity

Water

Propagation

- Asexually

- By Spores

1. Method one : in Medium

1. Method two: Wet Brick Method
